

AtlasGo

Project Summary & Presentation Guide

Project Overview: AtlasGo is a dynamic Travel & Tourism Booking Website built with PHP and MySQL. It serves as a bridge between travelers looking for holiday packages and a travel agency managing those bookings.

1. Technical Stack

- **Frontend:** HTML5, CSS3, JavaScript, Bootstrap 5, and FontAwesome. Integrates SweetAlert2 for modern pop-up notifications.
- **Backend:** Core PHP (handling secure session management, form submissions, and business logic).
- **Database:** MySQL relational database.

2. Database Architecture

The system revolves around 5 highly structured relational tables:

- **tbl_user:** Stores registered customer details (Name, Email, Mobile, Password).
- **tbl_destination:** Stores geographical locations (e.g., Kashmir, US, Hawaii) categorized by Domestic or International.
- **tbl_package:** Linked to destinations. Stores specific trip details (Price, Days/Nights, Description, Date).
- **tbl_booking:** The relational bridge linking a User to a Package, tracking the travel date and payment status.
- **tbl_gallery:** Stores paths to uploaded images for the photo gallery.

3. Step-by-Step Presentation Script

Follow this exact flow during your presentation to tell a complete story of how a user interacts with your website.

Phase 1: The User Journey (Frontend)

Step 1: The Home Page

- **Action:** Open home.php.
- **What to say:** "Welcome to AtlasGo. This is the landing page where users are introduced to our travel agency." Show them the navigation bar and layout.

Step 2: Registration & Login

- **Action:** Create a brand new user live, then log in.
- **What to say:** "First, a user needs an account. Let's register a new user and log in. Notice the secure authentication and the modern pop-up alerts (SweetAlert) when I log in successfully."

Step 3: Browse Destinations & Packages

- **Action:** Click on Destinations, then select a package (e.g., "KASHMIR").
- **What to say:** "Here, the database fetches all available destinations. When a user clicks a destination, they see all packages tied specifically to it using relational database queries."

Step 4: Make a Booking

- **Action:** Go through the booking process. Select dates, payment mode, and submit.
- **What to say:** "The core feature of the site is the booking engine. The user selects their preferences, and the system securely logs this booking into the database under their profile."

Phase 2: The Admin Dashboard (Backend)

Step 1: Log into the Admin Panel

- **Action:** Go to the login page. Log in using the Admin credentials (Username: **AdminUser** / Password: **admin123**).
- **What to say:** "Now, let's look at the system from the agency's perspective. Our system detects the Admin credentials and securely routes me to the Admin Dashboard."

Step 2: Dashboard & Management

- **Action:** Click through the sidebar to show "Add Destination" and "Add Package" forms.
- **What to say:** "From here, the admin has full CRUD control. I can upload new destination images directly to the server and create new packages without touching any code."

Step 3: Approve the Booking

- **Action:** Go to the Bookings section and find the booking you just made as a user.
- **What to say:** "Here is the booking our user just made. As the admin, I can track payment modes and update the payment status from 'Pending' to 'Completed'."

4. Final Pro-Tips for Your Presentation

- **Be Proud:** Emphasize that you built a system with actual file uploading capabilities and secure session management.
- **Keep it visual:** Spend 80% of your time clicking through the website acting like a user/admin, and only 20% showing code.
- **Security:** If asked, mention you used PHP `session_start()` to protect routes and ensure users cannot access pages if they aren't logged in.
